

# SCIENCE DAY AT BIOFACH WORLD EVENT

## RESEARCH AND INNOVATION FOR ORGANIC FOOD COMPANIES

On February 12, 2016, the fourth Science Day will take place at BIOFACH 2016 World Event (Nuremberg, Germany). It is a joint event of [TP Organics](#), the [European Technology Platform for Organic Food and Farming](#) and the [Technology Innovation Platform TIPI of IFOAM](#).

In the morning of Science Day 2016, TP Organics will focus on research and innovation for organic food companies. Organic companies will explain why innovation is so important for them. It will be discussed how the European commission can better support them. Over the next years the European Commission will build a Food Research Area. This Food Research Area aims to contribute to a “resilient food system that provides sustainable, affordable and healthy food for all”. Producing sustainable and healthy food is the day-to-day business of the organic food industry. The organic sector hence should play an important role in the design and implementation of the Food Research Area. Organic food companies are laboratories of creativity and innovation. They are always looking for new ways to improve the quality and health benefits of their products, while reducing their environmental impact.

In the afternoon, TIPI will discuss current challenges to organic agriculture in tropical zones and research policies in developing countries. It will also present its Vision and Strategy for Organic Food and Farming Research.
