

Agricultural Towers and their international promotion

The Courtirey firm continues promoting the Agricultural Towers in different and prestigious events in France and at international level.

The great interest shown was generated by the extremely good results of such an innovative solution. Agricultural towers are an answer to the management and preservation of water and soil. They provide solutions for the lack of cultivable grounds and use solar energy. The main objective of this innovation is to deal with water shortage, collecting rain water and watering excess in order to water the different levels of cultivation. The roof collects rain water, protects crops from violent storms, hail or strong sunlight. The raised tubs keep rodents and other crawling animals away, the crops are untouched by accidental liquid or solid pollution and it's now possible to work in an upright position.

In the new edition of the Courtirey's website you can find a dynamic presentation of the [Agricultural Towers](#).
